

GetRightHome — Subscription Flow, Current State

A description of how subscriptions work today across every panel, written from a read of the system and checked against the running backend and the live database. Nothing here is aspirational — where something is broken or dormant it says so.

- **Date of analysis:** 22 Aug 2026
- **Scope:** every subscription and membership surface in the platform

1. The headline

There is no single subscription system. There are **six independent ones**, built at different times, sharing no common design, no shared vocabulary and no shared payment path. Three are live, one is half-dead, one is dormant, and one has never worked.

#	SYSTEM	WHO IT IS FOR	STATE
1	Property subscriptions	Owner / Broker / Builder	Live — 7 plans, 3 subscribers
2	Worker subscriptions	Home-service workers	Dormant — no plans, no subscribers
3	Plus Membership	Home-service customers	Broken — never saves
4	VIP Membership	Buyers	Live — 2 members
5	Featured Plans	Admin-granted property promotion	Live — 3 plans, 2 featured listings
6	Subscription Tiers	Labels only, no behaviour	Live — 5 tiers

These systems do not know about each other. One person can hold a property subscription, a Plus Membership and VIP at the same time, and nothing reconciles them.

2. System 1 — Property Subscriptions

The main commercial system: what the platform sells to people who list property.

What a plan describes

A plan carries a display name, a target role (owner, broker or builder), a listing type (all, rent, buy, PG or commercial), a tier label, a price and a duration in days. Beyond that it sets the commercial terms: how many properties the subscriber may list, how many leads they may open, how much of a ranking boost their listings get, whether they earn a verified badge, what kind of banner placement they receive, and how many days they may pause the plan for.

There is **no buyer option** — the target role only accepts owner, broker or builder.

What a purchased subscription looks like

A subscription is stored directly on the user record as a single block: which plan, whether it is active, when it started and expires, how many properties have been used, the payment reference, how many leads have been consumed this month, and whether it is paused.

Because it is a single block on the user rather than a record of its own, **a person can hold exactly one subscription at any time**. Buying a second one overwrites the first. There is no way to attach a subscription to a specific property or project, no record of what was purchased at the time of purchase, and no pending, cancelled or failed state — a subscription is only ever active, expired or inactive.

The purchase journey

1. The subscriber opens the subscription page in their panel.
2. The panel asks the server for plans, passing the role and optionally a listing type.
3. The server returns every active plan matching that role and listing type.
4. The subscriber picks a plan and checkout begins.
5. If the plan is free, it activates immediately and the payment step is skipped entirely.
6. If it has a price, a Razorpay order is created and the payment sheet opens.
7. After payment, the browser sends the payment details back for verification.
8. The server checks the payment signature, then writes the subscription onto the user.

At activation the server also recounts how many live properties the subscriber has, so the usage figure shown matches what is actually enforced. Drafts and rejected listings do not count against the allowance.

What an active subscription actually unlocks

Only three things in the entire platform respond to it:

Listing limit. An active subscription grants the plan's property allowance. Without one, the subscriber falls back to the free trial allowance. Drafts are never blocked — a lister can always save work in progress, even after the trial has ended.

Lead contact details. On the received-enquiries screen, phone numbers and email addresses are masked unless the subscription is active. Admins always see them in full.

Search ranking. The public property search adds the lister's plan weight and verified status into a relevance score. It is one input among several — verification, real photos, freshness and engagement also count — so a paid boost alone cannot outrank a stronger listing.

A lead cap also exists, but it only applies to plans on the silver tier. Every other tier ignores the lead limit completely.

The free trial

The free trial is not a subscription. It is calculated from the account's creation date plus a platform-wide trial length, defaulting to 30 days. During the trial a lister gets a trial allowance of listings, defaulting to 10, and can skip the subscription screen. Once the trial elapses, submitting a property for approval is blocked until they subscribe.

3. Panel by panel

Admin panel

Admins and managers reach subscriptions from the admin and manager menus. Access is permission-gated separately for viewing, adding, editing and deleting.

What admin can do: create and edit plans, setting every commercial term listed above; deactivate a plan or delete it permanently; and manage the list of tier labels.

What admin cannot do: see who is subscribed, extend somebody's subscription, issue a refund, produce an invoice, build a quote, or view subscriptions that are about to expire. There is no screen anywhere in the admin panel that shows a purchased subscription — only the plan catalogue.

Revenue reporting is incomplete. The dashboard totals subscription revenue from partner accounts only. All owner, broker and builder accounts live in the main user collection, so two of the three current subscribers are missing from the figure.

Partner / Builder panel

The builder subscription page shows the trial state, offers a listing-type selector, sorts plans by tier, and runs the payment sheet.

The listing-type selector returns nothing. Every plan in the database was created before the listing-type field existed, so none of them carry a value for it. Filtering on any listing type therefore matches no plans at all, and the page shows "No plans available for this listing type yet." Removing the filter brings the plans back.

Owner / Broker panel

Owners and brokers reach their subscriptions from a "Boost Property Visibility" tile on the property dashboard. This page does not filter by listing type, so it does show plans.

The wording talks about boosting a property, but the purchase is **account-level** — nothing is attached to any particular listing. There is no per-property boost in this system at all.

Home-services customer panel

Two screens, neither of which can show anything:

- **My Subscription** is a fixed empty state. It makes no request and always reads "No subscription found."
- **My Plan** asks for the public plan list, but that endpoint always returns an empty list regardless of what is in the database. The page always reads "No subscription plans found at this time."

Worker panel

The worker subscription page lists plans, shows the current status, and runs a payment sheet. Both payment steps behind it are unimplemented placeholders that reject every request. There are no worker plans and no subscribed workers, so the page shows an empty list. The system is dormant end to end.

4. System 2 — Worker Subscriptions

A separate plan catalogue for home-service workers, with a title, description, price, duration and a list of feature lines. The worker record carries its own subscription block, unrelated to the property subscription block on users.

Buying is not possible — the order and verification steps are placeholders. However, a separate activation step exists that grants a full subscription with **no payment of any kind**, and it is only guarded by "must be a logged-in worker". It appears to have been intended for admin or automated use, but no admin check was ever applied.

This is currently harmless because no worker plans exist. It becomes a free-subscription hole the moment somebody creates one.

5. System 3 — Plus Membership

A home-services membership that covers selected categories and services at no charge, with bonus services on top. When a booking is placed with the Plus upsell selected, the system tries to write a one-year membership onto the customer's record. Booking pricing then checks that membership to decide whether a service is covered.

The membership never saves. The field it is written to was never defined on the user record, so the write is silently discarded. Confirmed against the database: no user carries the field, and the plan catalogue is empty. The check that reads it can therefore never be true, and no customer has ever held a Plus Membership.

The flag that triggers the upgrade also arrives from the browser rather than being derived from what was actually paid for — which would be a problem if any of it persisted.

6. System 4 — VIP Membership

A buyer membership, separate from everything else, recorded as two fields on the user: a VIP flag and an expiry date.

The price and duration are configured per city in the home-content settings, defaulting to ₹199 for 56 days. A Razorpay order is created carrying the correct price and duration, the buyer pays, and the browser returns the payment details for verification. The signature is checked, and VIP is switched on until the expiry date.

The duration is taken from the browser, not from the order. The correct value is stored on the order but never read back. The signature only proves that a payment happened, not what it bought — so the browser can claim any duration it likes after paying ₹199.

Two members are currently active.

7. System 5 — Featured Plans

A small catalogue of promotion levels — currently Pro, Gold and Silver — each with a ranking weight and a default duration. **None of them have a price**; these are not purchasable.

Featuring is applied to a property only by an admin, who picks the level, sets a duration and can attach a note. Two properties are currently featured.

This is the closest thing in the platform to a per-property promotion, and it has no customer-facing purchase path whatsoever.

8. System 6 — Subscription Tiers

A list of tier labels — Silver, Gold Basic, Gold, Platinum and Diamond — holding nothing but a name and a key. They exist so admin can pick a consistent tier when creating a plan.

Tier only changes behaviour in one place: the lead cap, which applies to silver plans and nothing else. Elsewhere it drives sort order in the panels.

9. Live data snapshot

Property plans — 7 total (4 owner, 2 broker, 1 builder)

PLAN	ROLE	TIER	PRICE	LISTINGS
Starter Silver Packs	Owner	Silver	₹999	5
Professional Gold Packs	Broker	Gold	₹2,499	10
Elite Diamond Packs	Owner	Diamond	₹4,999	35
testing plans for owners	Owner	Silver	₹1,111	2
for builderss	Builder	Silver	₹0	1
brokerss	Broker	Silver	₹0	2
only owner	Owner	Silver	₹0	1

Everything else

ITEM	COUNT
Subscription tiers	5
Active subscriptions (users)	2
Active subscriptions (partners)	1
VIP members	2
Worker plans / subscribed workers	0 / 0
Plus Membership plans / members	0 / 0
Featured plans / featured properties	3 / 2

User base: 18 owners, 9 builders, 7 brokers, 4 plain users.

Note that three of the seven plans are priced at ₹0, which means they activate instantly with no payment at all.

10. Findings

Ordered by consequence. Each was verified against the running system, not inferred.

F-1 — Eligibility is a display filter, not a rule

The server decides which plans to show based on a role sent by the browser, not the role of the person actually logged in. Checkout then accepts any plan with no eligibility check at all, and the subscription routes admit ordinary buyer accounts alongside listers.

The practical result: a buyer can ask for builder plans, be shown them, and purchase one. Profile-based visibility is presentational only.

F-2 — Verification trusts the browser for which plan was bought

After payment, the browser tells the server which plan to activate. The correct plan is recorded on the payment order but never read back. The signature proves a payment occurred; it does not tie that payment to a plan.

So paying ₹999 for the Silver plan and then naming the Diamond plan activates Diamond. VIP has the same weakness with its duration.

F-3 — The payment webhook activates nothing

Razorpay's server-to-server notification is received and its signature is verified correctly — and then every outcome is simply logged and discarded. Activation depends entirely on the browser coming back.

If a customer pays and closes the tab, they are charged and receive nothing, and there is no server-side record of the attempt to reconcile against. There is no orders record of any kind.

F-4 — Plus Membership has never worked

The membership is written to a field that does not exist on the user record, so it is silently thrown away. No user has ever held one.

F-5 — Filtering by listing type matches nothing

No plan in the database carries a listing type, because they all predate the field. Every filtered request therefore returns zero plans, and the builder panel's listing-type selector always shows an empty state.

F-6 — Nothing expires subscriptions

There is no scheduled job for subscriptions anywhere in the platform. Expiry works only because each screen compares the expiry date against today as it reads — so behaviour is correct, but the stored status goes stale and anything counting on status is wrong.

A live example: one owner's subscription lapsed 33 days ago and still reads as active. It is still being counted as a paying subscriber.

There are also no renewal reminders of any kind.

F-7 — Worker subscriptions can be granted without paying

The worker activation step grants a full subscription with no payment, guarded only by being a logged-in worker. Harmless today because no worker plans exist; a free-subscription hole as soon as one is created.

F-8 — Dead and misdirected screens

SYMPTOM	CAUSE
Pausing a subscription fails	The pause feature was written but never connected
Worker checkout fails	Both payment steps are unimplemented placeholders
My Plan is always empty	The endpoint it calls always returns an empty list
Home-services admin plan management fails	It calls an address that does not exist
My Subscription is always empty	Fixed empty state, makes no request

F-9 — Internal debug data in a live response

The plan list returned to every panel includes internal debugging fields describing the filter the server applied.

F-10 — Admin revenue undercounts

Subscription revenue is totalled from partner accounts only, missing the subscribers that live in the main user collection — currently two of the three.

11. How this compares to the target architecture

Measured against the 41-section subscription architecture specification:

TARGET	CURRENT STATE
Profile decides the eligible catalogue	Filter exists but is not enforced (F-1)
Sale and rental as separate categories	One shared field, defaulting to "all", matching nothing (F-5)
Buyer subscriptions	No buyer option exists
Builder estimates and custom quotes	Nothing
Boost from the My Properties screen	Nothing purchasable; admin-only featuring
Subscriptions as records of their own	A single block on the user
Entitlements frozen at purchase	Nothing — editing a plan changes what people already bought
Multiple subscriptions at once	Impossible — a second purchase overwrites the first
Property and project scope	Account level only
Activation driven by the payment webhook	Webhook does nothing (F-3)
Orders, invoices and payment records	No records of any kind
Lead scoring, assignment, activity history	Nothing
Sale and rental leads classified apart	Enquiries carry no listing type
Expiry job and renewal reminders	Nothing (F-6)

The single largest blocker is the shape of the subscription itself. Because it is one block on the user rather than a record of its own, multiple subscriptions, property-level boosts, project promotion and purchase-time entitlement snapshots are all structurally impossible until that changes. Most of the remaining gaps sit downstream of it.
